TRAVEL SCOPE — END-TO-END (Keep You In Scope)

Mission: One instrument, not another diagram.

You are going to Depot-PE-01 (or similar). Purpose: get one falsifiable number — monthly reconciliation cost — with tier T1/T2 and owner name. Nothing else.

What to bring:

- ONE-PAGER-DEPOT-THEY-SEE.pdf (1 page) — give to them
- THREE-PAGER-YOU-KEEP.pdf (3 pages) — keep for you, do not show
- Phone with depot_observation.py or notes app for recording format
- B-BBEE certificate image on phone (if asked about company)
- No kit. No hardware. No laptop for demo. No SMR diagrams.

What NOT to bring / say:

- Do NOT bring Mk 0.5 kit, no sensors, no Pi, no ADC
- Do NOT mention: SMR, HTGR, mineral refinery, bio-mineral, water isotopes, nuclear safeguards, IAEA, Ubuntu sovereignty, protocol licensing, AI control
- Do NOT mention prices R19,500/month or R195,000/month — those are 10x multipliers, [UNDEFINED]

Allowed words: fuel, litres in/out, reconciliation, sign-off cost, audit, owner, discrepancy, zero-fee 5-day trial, R1,671 kit, R5,000 pilot if >R1k found

End-to-End Flow — Same Spine

Before travel:

- Pick depot: fuel depot, not mine yet. Depot operator is logistics vendor — that's okay for Fact #1, but bridge to mine is NOT free. Record as [UNVERIFIED].
- Check DNS: vvu-enterprise.space-z.ai/support interim live, custom domain venturevisionubuntu.co.za/support pending HostAfrica CNAME
- Print one-pager, keep three-pager on phone

At scene — 5 minutes:

- Entry line verbatim: 'I'm building a tool for fuel reconciliation and trying to understand what the current process costs before I build anything. Three questions?'
- Ask Q1, Q2, Q3. Record: [date] [depot] [role] monthly reconciliation cost = R___ [T1/T2/T3/T4] owner = [name]
- Assign tier immediately: T1 sighted invoice, T2 named figure+owner, T3 estimate, T4 no number

After scene — 10 minutes in car:

- Run: python depot_observation.py --date 2026-03-26 --depot Depot-PE-01 --role 'Operations Manager' --cost 35000 --tier T2 --owner 'J. Smith (Finance)'
- Get contentHash (SHA-256 canonical 11-field) + receiptHash + gate PASS/CONDITIONAL/FAIL
- Write to WORM log: same as proofbridge/adapters/mbd.py 084a52ac... spine
- Email stakeholder verifiable receipt: 5-file bundle (claim, obligation, evidence, verification, receipt) — same as support endpoint

Gate: PASS = T1/T2 >R20k → Build kit #1. CONDITIONAL = T2 R10-20k → Rework price. FAIL = T4 or <R10k → Pivot vertical. Do NOT build kit #2 until PASS.

What Remains [UNDEFINED] — Explicitly Flagged

After this visit, these remain [UNDEFINED] — do NOT guess, do NOT interpolate — Zero-Fabrication baseline:

- Whether depot pays R5,000 for discrepancy finding — [UNDEFINED] until pilot agreement signed
- Whether 33% conversion holds — [UNDEFINED] until 3 depots observed
- Mineral attestation marginal cost — [UNDEFINED] — SGS/Intertek already on site
- Whether depot-to-mine sale is real — [UNVERIFIED] — depot operator ≠ mine procurement
- Whether it scales past one depot — [UNDEFINED]
- SMR/HTGR relevance — removed from Phase 1 — ledger grid-tolerant
- AI control of bioreactor — [UNDEFINED] — read-only anomaly detection only, no write path

---

Next steps gated:

- Fact #1: This visit — PASS? → Build kit #1 Mk 0.5 R1,671
- Fact #2: Kit #1 field test — does it find discrepancy >R1k? → Zero-fee 5-day trial
- Fact #3: Signed pilot agreement — 1-page, pay only if we find something
- Only after Fact #3 → Mineral pilot funding → TaaS R19,500/month (fuel) — R195k/month mineral remains [UNDEFINED] until measured

You are not running two projects. You are running one company with one product — verifiable physical flow records — sold into two verticals. Ledger is horizontal: same 11-field, SHA-256, Ed25519, chain.js/verify.js. Product is tamper-evident record of any physical flow. Fuel first. Minerals second. SMR third. Protocol fourth. One flywheel.
